PREFACE

The laws of nature are absolute, and if not given due respect while framing policies, programmes, and during execution of projects, can pose a serious threat to the very existence of human life. During his evolution, man stumbled upon various sources of energy. Starting from wood, coal, gasoline, nuclear energy to renewable energy, and every paradigm shift in energy brought about new challenges in limiting the damage caused to the environment.

This revised and updated edition of book **Basics of Energy & Environment** builds upon your understanding about the complexities in addressing environmental issues, bit by bit, through detailed diagrams, natural cycles, analysis, linkages, and statistics. Starting with the basic definitions of the fundamental units of environment, the book builds upon the complex web of ecosystem and ecology. Further, it goes on to map the ecological depletion, change in climate, and its impact on the various environmental processes.

No individual, country, or society howsoever powerful can survive the challenges of climate change on its own. This wisdom, arrived through various international conventions and treaties, has been beautifully constructed in a timeline while decoding and analysing every single move, which built upon our collective consciousness to this day.

The book organically builds upon the thought process, where you learn the complex interchanges of energy and environment in an effortless manner. Thus, you will be able to derive upon correct answers whatever be the spin given to the questions by UPSC in Engineering Services Examination (ESE). Energy and Environment is a hot topic, and this book ensures that you do not miss out on any question in the exam.

In this revised edition, some new topics have been added and a few existing chapters on subjects have been updated and elaborated; and have thus endeavoured to render it more complete and more worthy of the indulgent reception by ESE aspirants by whom it has been preferred so far.

CONTENTS

	<i>Preface</i>	<i>(iii)</i>
CHAPTER 1	ECOLOGY AND BIODIVERSITY	1 – 49
	1.1 Environment	1
	1.2 Layers of Atmosphere	3
	1.3 Levels of Ecological Organization	4
	1.4 Nutrients Cycle and Geochemical Cycles	11
	1.5 Ecosystem	16
	1.6 Biodiversity	24
	1.7 Biomes	29
	1.8 IUCN	30
	1.9 Environmental Conservation	32
	1.10 IUCN Protected Areas	33
	1.11 UNESCO Heritage Sites	36
	1.12 Wildlife	36
	1.13 Animal Welfare Board of India	38
	1.14 Conservation of Biodiversity	38
CHAPTER 2	ENERGY AND ITS CONSERVATION	50 – 73
	2.1 Introduction	50
	2.2 Types of Energy	50
	2.3 Type of Energy Resources	51
	2.4 India's Three-Stage Nuclear Power Programme	60
	2.5 Energy Governance	61
	2.6 Energy Organizations	63
	2.7 Management of Energy	65
	2.8 Future Sources of Energy	66
	2.9 Efficiency in Utilization of Energy	67
CHAPTER 3	POLLUTION	74 – 102
	3.1 Introduction	74
	3.2 Pollutants	74
	3.3 Air Pollution	75
	3.4 Water Pollution	81

3.5	Marine Pollution	85
3.6	Soil Pollution	87
3.7	Noise Pollution	89
3.8	Thermal Pollution	90
3.9	Radioactive Pollution	91
3.10	Food Contamination and Health	92
3.11	Pollution and Health Impact	92
CHAPTER 4	CLIMATE CHANGE	103 – 126
4.1	Introduction	103
4.2	Weather	104
4.3	Causes of Climate Change	105
4.4	Global Warming	107
4.5	Consequences of Climate Change	111
4.6	Humidity	114
4.7	Consequences of Global Warming and Climate Change in India	115
4.8	Adaptive Strategies for Mitigating Climate Change	115
4.9	Distribution of Fossil Fuels in India	117
4.10	The Economics of Ecosystems and Biodiversity	118
4.11	REDD & REDD+	118
4.12	Government Initiatives to Mitigate Climate Change	118
CHAPTER 5	ENVIRONMENT : DEGRADATION AND CONSERVATION	127 – 147
5.1	Introduction	127
5.2	Natural Resources	127
5.3	Natural Resources: Degradation and Conservation	129
5.4	Atmosphere and Environment Conservation	135
5.5	Waste Management	135
5.6	Solid Waste Management in India	142
CHAPTER 6	ENVIRONMENTAL IMPACT ASSESSMENT	148 – 159
6.1	Introduction	148
6.2	Need for EIA	149
6.3	Objective of EIA	150
6.4	Categories of Development Projects in which EIA is Mandatory (MOEF 1994, MOEF 2001)	151
6.5	Characteristic Features of a Good EIA	152
6.6	Environmental Appraisal Committee (EAC)	154
6.7	Roles of Parties in EIA Process	154

6.8	Benefits of EIA	155
6.9	Limitations of EIA	155
6.10	Environmental Impact Survey	155
CHAPTER 7	CONVENTIONS AND PROTOCOLS	160 – 176
7.1	Introduction	160
7.2	Time Line	161
7.3	Major Conventions	161
CHAPTER 8	MISCELLANEOUS AND CONTEMPORARY ISSUES	177 – 212
8.1	Green Glossary	177
8.2	International Green Days	178
8.3	Green Institutes/Initiatives	178
8.4	Green Awards	179
8.5	Red Events	180
8.6	Green Parameters	180
8.7	Contemporary Issues in Environment	181
8.8	Sustainable Development	204
8.9	Millennium Development Goals	205
8.10	Sustainable Development Goals (SDGS)	206
8.11	Various Indices Related to Environment	207

CHAPTER

1

Ecology and Biodiversity

1.1 ENVIRONMENT

INSIDE

- 1.1 Environment
- 1.2 Layers of Atmosphere
- 1.3 Levels of Ecological Organization
- 1.4 Nutrients Cycle and Geochemical Cycles
- 1.5 Ecosystem
- 1.6 Biodiversity
- 1.7 Biomes
- 1.8 IUCN
- 1.9 Environmental Conservation
- 1.10 IUCN Protected Areas
- 1.11 UNESCO Heritage Sites
- 1.12 Wildlife
- 1.13 Animal Welfare Board of India
- 1.14 Conservation of Biodiversity

- Environment is defined as, “the sum total of living and non-living components, influences and events surrounding an organism”.
- German biologist **Ernst Haeckel** coined ‘**ecology**’ in 1869. It is the scientific study of reciprocal relationship between living organisms with their environment namely abiotic and biotic components.
- Each and every living organism has a specific surrounding with which it continuously interacts, derives its sustenance and fully adapts. This surrounding is the ‘**natural environment**’.
- According to Environment Protection Act 1986, environment is sum of total water, air and land, inter-relationship among themselves and also with human beings, other living organism and property.

Question 1

Statement (I): Training should be conducted among the line and low management for ensuring the importance of environmental protection plan.

Statement (II): Environmental science is a developing subject and the people implementing environment strategies should remain up to date with the environmental control process.

Codes:

- (a) Both Statement (I) and Statement (II) are individually true and Statement (II) is the correct explanation of Statement (I).
- (b) Both Statement (I) and Statement (II) are individually true but Statement (II) is not the correct explanation of Statement (I).
- (c) Statement (I) is true but Statement (II) is false.
- (d) Statement (I) is false but Statement (II) is true.

[ESE-2019]

Ans: (a)

Environmental science is the study of the effects of natural /unnatural processes, and the interactions of the physical components of the planet on the environment.

It is developing in nature and is still evolving. So the scientists, researchers and other people who are implementing various environment strategies and procedures should be given training; especially persons working in low management.

Training and guidance should be given about all the environmental control processes and the importance of environmental protection plan.

It will enhance the efficiency of the people implementing various environment protection plan and also improve its implementation.

1.1.1 Components of Environment

Atmosphere

- It is a layer of gases (air) surrounding the planet. Atmosphere is of vital significance to life as all components of air (except inert gases) serve as key metabolites for living organisms.
- According to temperature, the atmosphere contains four different layers:
 - The first layer is called the **troposphere** (8 to 16 kms)
 - The layer above troposphere is the **stratosphere** (varies from 11 to 50 kms). Ozone is found in the atmosphere at varying concentration between the altitudes of (10 to 50 kms). This layer is also called the ozone layer.
 - Above stratosphere, lies **mesosphere** (upto 80 kms)
 - The last atmospheric layer has an altitude greater than 80 kms and is called **thermosphere**.

Gases	Percentage by volume
Nitrogen	78.08
Oxygen	20.95
Argon	0.93
Carbon dioxide	0.03

Composition of Atmosphere

Lithosphere

- It is the solid, outer part of the Earth and includes the brittle upper portion of the mantle and the crust

(the outermost layers of Earth's structure). It is bounded by the atmosphere above and the asthenosphere (another part of the upper mantle) below. It is the most rigid of Earth's layers.

- The most well-known feature associated with Earth's lithosphere is tectonic activity. Tectonic activity describes the interaction of the huge slabs of lithosphere called tectonic plates.
- Most tectonic activity takes place at the boundaries of these plates, where they may collide, tear apart, or slide against each other. The movement of tectonic plates is made possible by thermal energy (heat) from the mantle part of the lithosphere. Thermal energy makes the rocks of the lithosphere more elastic.
- Tectonic activity is responsible for some of Earth's most dramatic geologic events: earthquakes, volcanoes, orogeny (mountain-building), and deep ocean trenches can all be formed by tectonic activity in the lithosphere.

Hydrosphere

- The hydrosphere is composed of all of the water on or near the earth.
- It ranges from 10 to 20 kms in thickness.
- Ninety seven percent of earth's water is salty. The remaining three percent is fresh water, three quarters of the **fresh water** is solid and **exists in ice sheets**.
- It includes water that is on the surface of the planet, underground, and in the air. A planet's hydrosphere can be liquid, vapour, or ice.
- Water moves through the hydrosphere in a cycle. Water collects in clouds, then falls to Earth in the form of rain or snow. This water collects in rivers, lakes and oceans. Then it evaporates into the atmosphere to start the cycle all over again. This is called the water cycle.

Biosphere

- The biosphere is composed of all living organism. The biosphere is responsible for the grand scale recycling of energy and matter on Earth.
- The mobilization of matter by biota is by no means restricted to small geographic regions.
- The periodic burning of forests and savannas, not only change the chemical form of matter, but also result in long-range atmospheric transport and deposition.

1.2 LAYERS OF ATMOSPHERE

- Basing on the temperature, the atmosphere can be divided into four layers: troposphere, stratosphere, mesosphere, and thermosphere.
- The temperature drops as we go up through the troposphere, but it rises as we move through the next layer, the stratosphere. The farther away from earth, the thinner the atmosphere gets.

1. Troposphere

- This layer of the atmosphere closest to the Earth's surface, extending up to about 10-15 km above the Earth's surface. It contains 75% of the atmosphere's mass.
- The troposphere is wider at the equator than at the poles. Temperature and pressure drops as we go higher up the troposphere.
- **Tropopause:** At the very top of the troposphere is the tropopause, where the temperature reaches a (stable) minimum. the tropopause is a “**thermal layer**” or “**cold trap**” because is this the maximum limit to which water vapour can rise, as it changes into ice and gets trapped. If there is no cold trap, Earth would lose all its water. Most of weather phenomena occurs in the troposphere.

2. Stratosphere

- This layer lies directly above the troposphere and is about 35 km deep. It extends from about 15 to 50 km above the Earth's surface.

- The stratosphere is warmer at the top than at the bottom. The lower portion has a near constant temperature, but in the upper portion the temperature increases with altitude because of absorption of sunlight by ozone.
- **The Ozone Layer:** The stratosphere contains a thin layer of ozone molecules which forms a protective layer shielding life on Earth from the Sun's harmful ultraviolet radiation.

3. Mesosphere

- Directly above the stratosphere, 50 to 80 km above the Earth's surface, the mesosphere is a cold layer where the temperature generally decreases with increasing altitude.
- Here in the mesosphere, the atmosphere is very rarefied nevertheless thick enough to slow down meteors hurtling into the atmosphere, where they burn up, leaving fiery trails in the night sky.

4. Thermosphere

- The thermosphere extends from 80 km above the Earth's surface to outer space. The temperature is hot, as high as thousands of degrees as the few molecules that are present in the thermosphere receive extraordinarily large amounts of energy from the Sun.
- The thermosphere corresponds to the heterosphere, a zone where there is no uniform distribution of gases, instead they are layered, in accordance to their molecular masses. In contrast, the gases in the homosphere (consisting of the troposphere, stratosphere and mesosphere) are uniformly distributed.
- The **ionosphere** is a region of Earth's upper atmosphere, from about 60 km to 1,000 km altitude, and includes the thermosphere and parts of the mesosphere and exosphere.
- It is ionized by solar radiation, plays an important part in atmospheric electricity and forms the inner edge of the magnetosphere.
- It has practical importance because, among other functions, it influences radio propagation to distant places on the Earth.
